

ABSTRACT

An operation means box device that is disposed on the side of an operator seat; in which an operation means box that has operation means on the upper surface is freely movably installed in the front-rear direction relative to the operator seat; and which comprises locking means for fixing the operation box at a prescribed position, that can minimize the operator's fatigue in operating the operation means provided in the operation means box, in which an unlocking handle for unlocking the locking means is disposed in a location other than the upper surface of the operation means box.
